

Status, Longship 01.09.2022

Highlights

- Construction of the Northern Lights CO₂ transport and storage infrastructure and the Norcem plant is well underway. Brevik CCS is 40% completed, Northern Lights storage facility is 44% completed and Celsio's CO₂ capture project at the waste-to-energy plant in Oslo has just started.
- Overall progress of Longship's construction phase:

Background – about Longship

- The CCS project Longship, partly funded by the Norwegian government, includes the capture, transport and storage of CO₂.
- A carbon capture facility is currently being built at the Norcem's cement plant in Brevik, Norway, by Heidelberg Cement. According to plan, the facility will capture approximately 400,000 tonnes of CO₂ from late 2024.
- Celsio will, according to plan, capture approximately 400,000 tonnes of CO₂ annually from its waste-to-energy plant in Oslo from 2026.
- Northern Lights is currently developing a solution for the transport and storage of CO₂. The CO₂ will be transported by ship from the various emission sources to a receiving facility near Bergen, before being transported by pipeline for permanent storage in a reservoir located 2600 metres below the seabed.
- Several measures are needed to enable European countries to achieve carbon neutrality.
 Longship will help the hard-to-abate industries reduce their CO₂ emissions and make carbon negative emissions possible.

Roles in Longship

- **Ministry of Petroleum and Energy** Responsible for Norway's CCS policy and Longship on behalf of the Norwegian government
- Ministry of Foreign Affairs Coordinates Norway's foreign service and embassies
- Gassnova State owned company following up Longship on behalf of the Ministry of Petroleum and Energy
- **Northern Lights** Transport and storage company receiving carbon from Norcem and potentially Celsio, and aiming to receive carbon from multiple sources
- Brevik CCS Norcem, HeidelbergCement Capture site under construction at the cement plant in Brevik
- **Hafslund Oslo Celsio** Capture project working to secure additional funding for a capture site at the waste-to-energy plant in Oslo

Status Northern Lights

- Construction of the Northern Lights CO₂ storage facility is **44%** completed (2022.07.31) and on schedule to start operations in 2024 as planned.
- At the receiving terminal construction of the project office and visitor centre is about to be completed and will open in October. Fabrication and installation of the onshore plant is ongoing.
- The first offshore CO₂ injection well was drilled already in 2020 and a second well is about to be drilled. Fabrication of CO₂ pipeline is ongoing. The umbilical production is completed and will be installed in Q3 2022.
- In October 2021, Northern Lights awarded contracts to Dalian Shipbuilding Industry Co., Ltd. (DSIC) for building of two ships dedicated for CO₂ transport. The ships are now **9%** completed (2022.07.31) and will be delivered in the first half of 2024.
- Yara and Northern Lights have signed the world's first commercial agreement on cross border CO₂ transport and storage. From early 2025, 800,000 tonnes of CO₂ will according to the agreement be captured from Yara's ammonia and fertiliser plant in Sluiskil in the Netherlands and transported and stored by Northern Lights. With that, the first phase of Northern Lights is fully booked. There are plans to apply for permission to expand capacity.
- Northern Lights is, together with partners in several European countries, recognized as
 Project of Common Interest (PCI) by the European Commission and has received CEF funding
 for a phase 2 study. The Phase 2 onshore and jetty FEED studies have now started and an
 investment decision for Phase 2 will be conclude by Q1 2023. In phase 2 the capacity of the
 storage site will increase from 1,5 million tonnes a year to 5-7 million tonnes a year.
- Four potential customers to Northern Lights passed selection for Innovation Fund support in
 the first round (2021) and funds for these projects are now allocated by EU. Three potential
 new customers passed the selection in Innovation Fund's second round in July this year.
 Maturing commercial agreements between potential customers and Northern Lights is
 continuing. Northern Lights is also in dialogue with customers not relying on funding from
 the EU Innovation Fund.

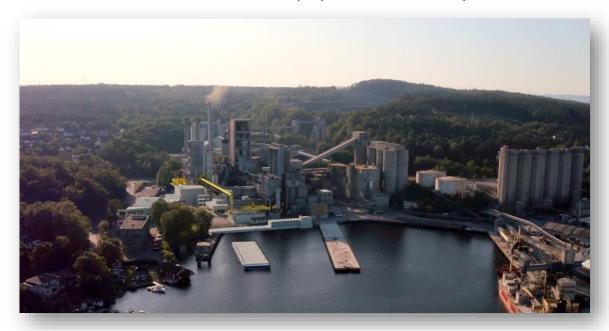

Northern Lights' CO_2 receiving terminal in Øygarden.

Status Norcem

- Overall accumulated actual progress is 40% for the Brevik CCS Project (2022.07.31).
- Brevik CCS is currently in the transition zone from the phase where engineering has been the
 dominant activity, to the phase where construction and other site activities are dominant.
 Generally, Brevik CCS is progressing well, but the project organisation expresses some
 concern about delays from subcontractors, mainly due to effects from covid-19 and the war
 in Ukraine.
- Norcem's updated cost estimates from October 2021 show that Norcem is expected to
 exceed the maximum budget in the subsidy agreement between the state. In accordance
 with the state aid agreement, the parties are obliged to jointly seek an agreed solution for
 financing the cost overrun and the project. The negotiation between the parties is ongoing
 and in the meantime the project is progressing as planned.
- Brevik CCS has experienced vast interest internally and externally. HeidebergCementGroup now has several emerging projects in other countries, mainly in Europe and North America. BrevikCCS is the frontrunner both within the company and within the industry.

Norcem's plant will be transformed with a new capture plant on site.

Status Celsio

- On June 29th the Minister of Petroleum and Energy Terje Aasland signed the support
 agreement that ensures the realization of carbon capture at Hafslund Oslo Celsios (Celsio)
 waste incineration plant at Klemetrud in Oslo. The agreement marks that the Norwegian
 state, Oslo Municipality and Celsio's owners; Hafslund Eco, Infranode and HitecVision, now
 will realize the world's first carbon capture and storage plant on waste incineration.
- Celsio's carbon capture project started the civil works, blasting and ground works on site in August this year. Construction of the capture plant will be finished in 2025 and the plant will be capturing 400 000 tonnes of CO₂ from 2026.

• In March 2022 Fortum signed an agreement to sell its 50 % ownership in the waste-to-energy and thermal energy company to an investor consortium comprising Hafslund, Infranode and HitecVision. Following the transaction, Hafslund (owned by the Municipality of Oslo) became the majority owner with 60 per cent ownership in Hafslund Oslo Celsio, while Infranode and HitecVision will have significant minority position of 20 per cent each.

Hafslund Oslo Celsio's CO₂ capture plant will be capturing 400 000 tonnes of CO₂ from 2026.

CO₂ storage in Norway

• In April three companies were offered exploration licenses to store CO₂ in two areas on the Norwegian Continental Shelf. The area in the North Sea was offered to Equinor ASA, and the area in Barents Sea was offered to a group including Equinor ASA, Horisont Energi AS and Vår Energi AS. This is the second time that area is awarded for CO₂ storage pursuant to the CO₂ Storage Regulations. Northern Lights was awarded for the storage part of Longship in 2019. A new area for CO₂ storage in the North Sea was also announced by the MPE in April due to interest from the industry.
